THE MISSING SIGNAL

How **SBC Labs** is measuring financial readiness for rural households with no transaction data at all.

Richard Lawrence

BigHammer.ai

Hundreds of millions of people in rural India have no transaction data.

So how does a bank, a FinTech or a microfinance institution tell who is ready for savings, credit, investment or insurance?

BigHammer.ai

No transaction history means you build the signal from what does exist.

- Surveys
- Programmable data
- Product usage signals
- Phone usage
- Internet penetration

BigHammer.ai

DEMAND EXISTS. MEASUREMENT DOESN'T.

BigHammer.ai

That makes it a data engineering problem before it is anything else.

- → Onboard many sources that look nothing alike
- → Catalogue each one with its business context
- → Triangulate them with NLP
- → Model them into **one Customer Readiness Score**

BigHammer.ai

BIGHAMMER.AI'S AI DATA ENGINEER

Onboarded the sources. Catalogued them. Triangulated them into one score.

THE SBC LABS TEAM

Kept what only they bring: behavioural science, design and two decades of experience across 10+ countries.

BigHammer.ai

“

Anushka Ashok

Co-Founder, SBC Labs

BigHammer transformed a multi-year data engineering challenge into a production-ready platform in months, without requiring a technical team.”

Why it matters

- Banks, FinTechs and microfinance institutions can find people who are ready but underserved
- Including women in rural India
- Next: agriculture insurance, auto financing, farm equipment leasing, healthcare access

BigHammer.ai

Got a data problem everyone has filed under “multi-year”?

Bring it to a demo. I’d be glad to talk it through and give you an honest view of what it would take.
